

Jackson Creek - Botany Survey Interim Report

Survey period: August 17 - September 18, 2026. Surveyors: district botany crew (3 people).

Methods: intuitive-controlled floristic surveys of all four treatment units, with focused searches in mesic openings and along the riparian corridor.

Results to date: 212 vascular plant taxa recorded. One new occurrence of Cuyamaca larkspur (*Delphinium hesperium* ssp. *cuyamaca*), a Forest Service sensitive species, was found at survey point SP-01 in unit JC-01 (approximately 40 plants).

Invasive species: tamarisk (*Tamarix ramosissima*) and giant reed (*Arundo donax*) are present along roughly 1.8 miles of Jackson Creek in unit JC-04; yellow star-thistle is scattered along NFSR 15S04.

Recommendations: flag a 100-foot avoidance buffer around the SP-01 occurrence; clean equipment before entering units; schedule invasive removal before seed set.

Remaining work: late-season surveys of unit JC-02 north slopes, to be completed by October 9, 2026.
